Bob is standing at cell `(0, 0)`, and he wants to reach `destination`: `(row, column)`. He can only travel **right** and **down**. You are going to help Bob by providing **instructions** for him to reach `destination`.

The **instructions** are represented as a string, where each character is either:

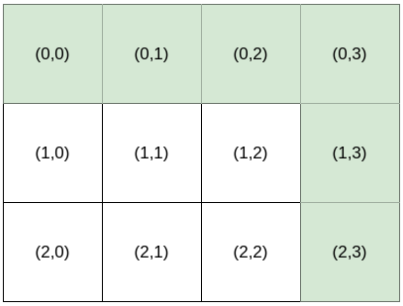
- `'H'`, meaning move horizontally (go **right**), or
- `'V'`, meaning move vertically (go **down**).

Multiple **instructions** will lead Bob to `destination`. For example, if `destination` is `(2, 3)`, both `"HHHVV"` and `"HVHVH"` are valid **instructions**.

However, Bob is very picky. Bob has a lucky number `k`, and he wants the `k`$^{th}$ **lexicographically smallest instructions** that will lead him to `destination`. `k` is **1-indexed**.

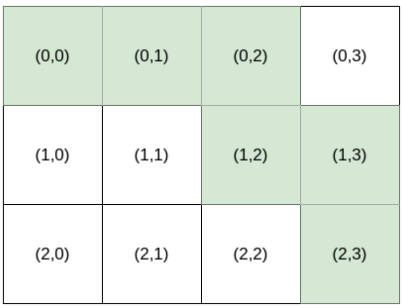
Given an integer array `destination` and an integer `k`, return *the* `k`$^{th}$ ***lexicographically smallest instructions*** *that will take Bob to* `destination`.

**Example 1:**



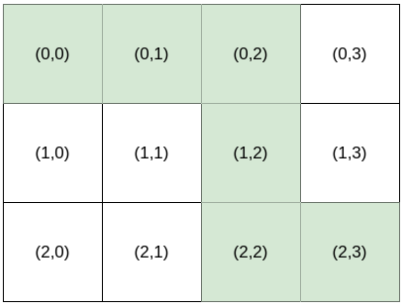
```
Input: destination = [2,3], k = 1
Output: "HHHVV"
Explanation: All the instructions that reach (2, 3) in lexicographic order are as follows:
["HHHVV", "HHVHV", "HHVVH", "HVHHV", "HVHVH", "HVVHH", "VHHHV", "VHHVH", "VHVHH", "VVHHH"].
```

**Example 2:**



```
Input: destination = [2,3], k = 2
Output: "HHVHV"
```

**Example 3:**



```
Input: destination = [2,3], k = 3
Output: "HHVVH"
```

**Constraints:**

- `destination.length == 2`
- `1 <= row, column <= 15`
- `1 <= k <= nCr(row + column, row)`, where `nCr(a, b)` denotes `a` choose `b`.

JavaScript

```
/**
 * @param {number[]} destination
 * @param {number} k
 * @return {string}
 */
var kthSmallestPath = function(destination, k) {

};
```
