

5701. Check if One String Swap Can Make Strings Equal

[My Submissions \(/contest/weekly-contest-232/problems/check-if-one-string-swap-can-make-strings-equal/submissions/\)](#)

[Back to Contest \(/contest/weekly-contest-232/\)](#)

You are given two strings `s1` and `s2` of equal length. A **string swap** is an operation where you choose two indices in a string (not necessarily different) and swap the characters at these indices.

Return `true` if it is possible to make both strings equal by performing **at most one string swap on exactly one of the strings**. Otherwise, return `false`.

Example 1:

Input: `s1 = "bank", s2 = "kanb"`
Output: `true`
Explanation: For example, swap the first character with the last character of `s2` to make `"bank"`.

Example 2:

Input: `s1 = "attack", s2 = "defend"`
Output: `false`
Explanation: It is impossible to make them equal with one string swap.

Example 3:

Input: `s1 = "kelb", s2 = "kelb"`
Output: `true`
Explanation: The two strings are already equal, so no string swap operation is required.

Example 4:

Input: `s1 = "abcd", s2 = "dcba"`
Output: `false`

Constraints:

- `1 <= s1.length, s2.length <= 100`
- `s1.length == s2.length`
- `s1` and `s2` consist of only lowercase English letters.
