(Easy)

We can similarly define the **nesting depth** depth(S) of any VPS S as follows:

- depth("") = 0
- depth(A + B) = max(depth(A), depth(B)), where A and B are VPS's
- depth("(" + A + ")") = 1 + depth(A), where A is a **VPS**.

For example, "", "()()", and "()(()())" are VPS's (with nesting depths 0, 1, and 2), and ")(" and "(()" are not VPS's.

Given a VPS represented as string s, return the nesting depth of s.

• It can be written as (A), where A is a VPS.

Example 1:

```
Input: s = "(1+(2*3)+((8)/4))+1"
Output: 3
Explanation: Digit 8 is inside of 3 nested parentheses in the string.
```

Example 2:

```
Input: s = "(1)+((2))+(((\underline{3})))"
Output: 3
```

Example 3:

```
Input: s = "1+(2*3)/(2-1)"
Output: 1
```

Example 4:

```
Input: s = "<u>1</u>"
Output: 0
```

Constraints:

- 1 <= s.length <= 100
- s consists of digits 0-9 and characters '+', '-', '*', '/', '(', and ')'.
- It is guaranteed that parentheses expression s is a VPS.
