100143. Count Tested Devices After Test Operations

My Submissions (/contest/weekly-contest-375/problems/count-tested-devices-after-test-operations/submissions/)

Back to Contest (/contest/weekly-contest-375/)

You are given a **0-indexed** integer array batteryPercentages having length n, denoting the battery percentages of n **0-indexed** devices.

Your task is to test each device i in order from 0 to n-1, by performing the following test operations:

- If batteryPercentages[i] is greater than 0:
 - o Increment the count of tested devices.
 - \circ Decrease the battery percentage of all devices with indices j in the range [i + 1, n 1] by 1, ensuring their battery percentage **never goes below** \emptyset , i.e, batteryPercentages[j] = max(\emptyset , batteryPercentages[j] - 1).
 - o Move to the next device.
- · Otherwise, move to the next device without performing any test.

Return an integer denoting the number of devices that will be tested after performing the test operations in order.

User Accepted: 0 User Tried: 0 **Total Accepted:** 0 **Total Submissions:** 0 Difficulty: Easy

Example 1:

```
Input: batteryPercentages = [1,1,2,1,3]
Output: 3
Explanation: Performing the test operations in order starting from device 0:
At device 0, batteryPercentages [0] > 0, so there is now 1 tested device, and batteryPercentages becomes [1,0,1,0,2].
At device 1, batteryPercentages[1] == 0, so we move to the next device without testing.
At device 2, batteryPercentages [2] > 0, so there are now 2 tested devices, and batteryPercentages becomes [1,0,1,0,1].
At device 3, batteryPercentages[3] == 0, so we move to the next device without testing.
At device 4, batteryPercentages[4] > 0, so there are now 3 tested devices, and batteryPercentages stays the same.
So, the answer is 3.
```

Example 2:

```
Input: batteryPercentages = [0,1,2]
Output: 2
Explanation: Performing the test operations in order starting from device 0:
At device 0, batteryPercentages[0] == 0, so we move to the next device without testing.
At device 1, batteryPercentages[1] > 0, so there is now 1 tested device, and batteryPercentages becomes [0,1,1].
At device 2, batteryPercentages[2] > 0, so there are now 2 tested devices, and batteryPercentages stays the same.
So, the answer is 2.
```

Constraints:

- 1 <= n == batteryPercentages.length <= 100
- 0 <= batteryPercentages[i] <= 100

```
