5803. Longest Common Subpath

My Submissions (/contest/weekly-contest-248/problems/longest-common-subpath/submissions/)

Back to Contest (/contest/weekly-contest-248/)

There is a country of `n` cities numbered from `0` to `n − 1`. In this country, there is a road connecting **every pair** of cities.

There are `m` friends numbered from `0` to `m − 1` who are traveling through the country. Each one of them will take a path consisting of some cities. Each path is represented by an integer array that contains the visited cities in order. The path may contain a city **more than once**, but the same city will not be listed consecutively.

Given an integer `n` and a 2D integer array `paths` where `paths[i]` is an integer array representing the path of the `i`th friend, return *the length of the* ***longest common subpath*** *that is shared by* ***every*** *friend's path, or* `0` *if there is no common subpath at all.*

A **subpath** of a path is a contiguous sequence of cities within that path.

Example 1:

```
Input: n = 5, paths = [[0,1,2,3,4],
                       [2,3,4],
                       [4,0,1,2,3]]
Output: 2
Explanation: The longest common subpath is [2,3].
```

Example 2:

```
Input: n = 3, paths = [[0],[1],[2]]
Output: 0
Explanation: There is no common subpath shared by the three paths.
```

Example 3:

```
Input: n = 5, paths = [[0,1,2,3,4],
                       [4,3,2,1,0]]
Output: 1
Explanation: The possible longest common subpaths are [0], [1], [2], [3], and [4]. All have a length of 1.
```

Constraints:

- $1 <= n <= 10^5$
- `m == paths.length`
- $2 <= m <= 10^5$
- $sum(paths[i].length) <= 10^5$
- `0 <= paths[i][j] < n`
- The same city is not listed multiple times consecutively in `paths[i]`.
